Step 7 — Preview and samples (wizard steps 5 and 6)

Goal: hear the real Minecraft result, then prepare all the audio files.

Preview (step 5)

Converted preview

1. The samples needed for the preview are prepared automatically (the first time takes a few seconds).
2. **Converted (Minecraft samples)** plays the song as the game will: notes aligned on 50 ms ticks, each sound played in full, 8 velocity levels.
3. **Original MIDI** switches back to the original at the same position, to compare.
4. **Listen to** lets you hear one track only.

Exporting the audio (full edition)

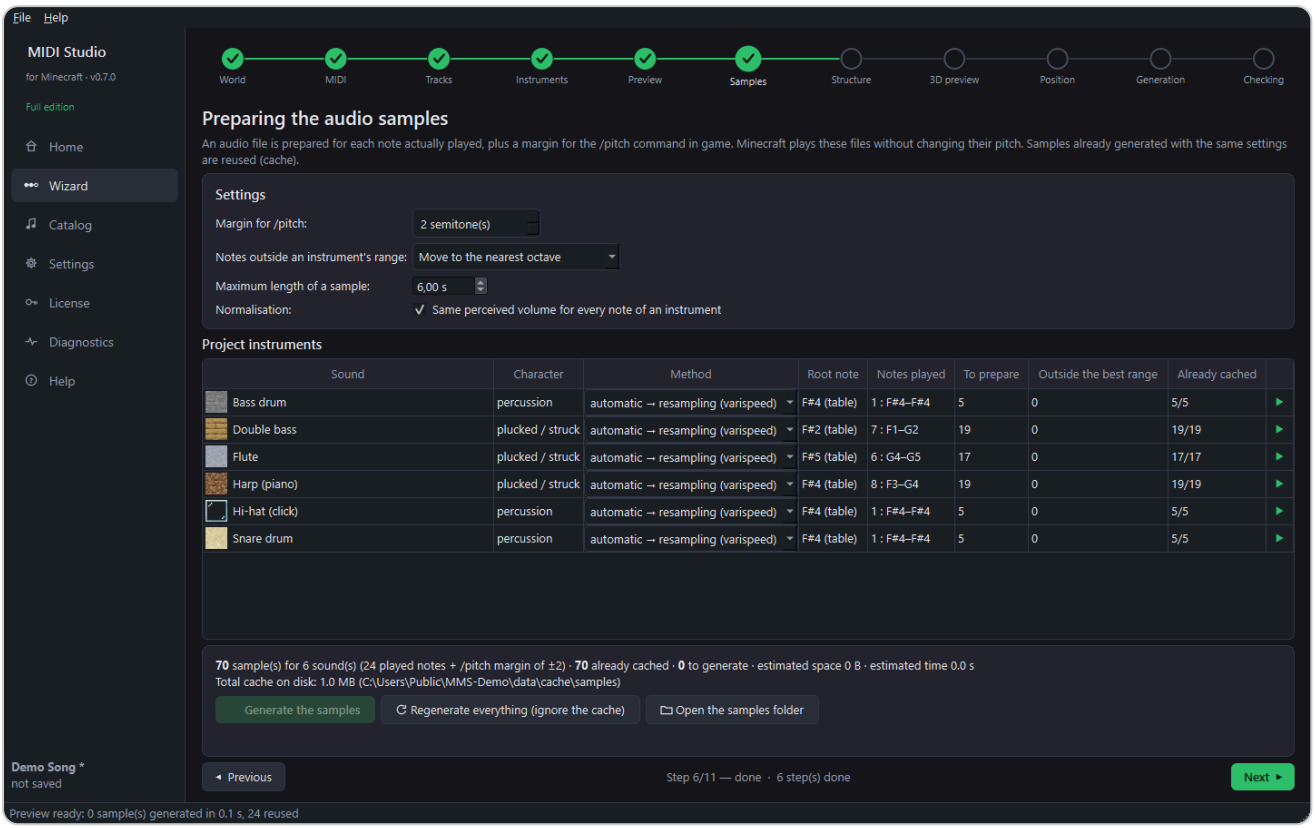

Export the audio… saves the song as a file, for example for the soundtrack of a video:

- **Sound**: *Minecraft* (the real samples, as in the game) or *Original MIDI*;

- **Tracks**: all the selected tracks mixed, or a single one;
- **Format**: MP3, WAV, FLAC or OGG.

The file is at least as long as the song, which makes it easy to sync with a video.

Samples (step 6)

Sample generation

One audio file is prepared **for each note actually played**, so Minecraft never has to change the pitch of a sound (that is what makes the result clean).

- **Margin for /pitch** — extra notes so that the in-game `/function music:<name>/pitch` command always finds a sample.
- **Notes outside an instrument's range** — moved to the nearest octave, skipped, or generated anyway.
- **Maximum length of a sample** — long sounds are shortened with a fade.
- **Normalisation** — same perceived volume for every note of an instrument.
- **Method** per instrument — *resampling* (classic note block sound) or *pitch only* (keeps the duration, better for voices).

Click **Generate the samples**. Samples already made with the same settings are reused from the cache.

Next guide: the structure.
