Step 13 — Playing on a server

Goal: use the music on a multiplayer server (full edition).

1. In step 11, click **Export for a server...** and choose a folder. You get:
   - `music_<name>.zip` (the song's datapack);
   - the resource pack (`.zip`);
   - `README-SERVER.txt`: the instructions, with the pack's **SHA-1**.
2. **Datapack**: copy `music_<name>.zip` into `<server world>/datapacks/`, then type `/reload` (or restart the server).
3. **Resource pack**: put the resource pack at a **direct download address** (HTTP or HTTPS), then in `server.properties`:

   ```
   resource-pack=<address of the file>
   resource-pack-sha1=<SHA-1 given in the instructions>
   require-resource-pack=true   (optional)
   ```

4. For the button console: `enable-command-block=true` in `server.properties`.
5. In game, as an operator: `/function music:<name>/wand` for the placement wand (right-click a block = front left corner of the structure, zone shown in blue), then `/function music:<name>/build` and `/function music:<name>/play`. With fixed coordinates chosen in the software, the wand is not needed.

Players who are not operators control the music with `/trigger music.<name>.play`, `/trigger music.<name>.volume set 150`, etc.

Several songs on the server: copy each datapack into `datapacks/`. The server accepts **one** resource pack: install the songs in a world with the software (step 10), then host the `resources.zip` of that world, which holds the sounds of all of them (compute its SHA-1 for example with `certutil -hashfile resources.zip SHA1`).

> The sounds of the pack are Minecraft's (they belong to Mojang): use them for your server, but do not publish the pack.

Next guide: troubleshooting.
